Redux

Redux
- A JS library for predictable and maintainable global state management
- It is used to manage the state globally

const [user,setUser] = useState(null)
- get
- set

```
class Singleton{
static Singleton ref ;

private Singleton(){
}

public static Singleton getInstance(){

    return new Singleton();
}

}
```

const[cartItems,setCartItems]= useState()
- get
- set (add to cart)

- remove from cart
- clear cart
- incremantqty
- decrementqty

newState
- do modifications in the copy
- set in the state

```
const res =
setCount(res)
```

Redux

```
let initialState = {
        count:2
}

function CounterReducer(initialState,action){
        const newState = {...initialState}

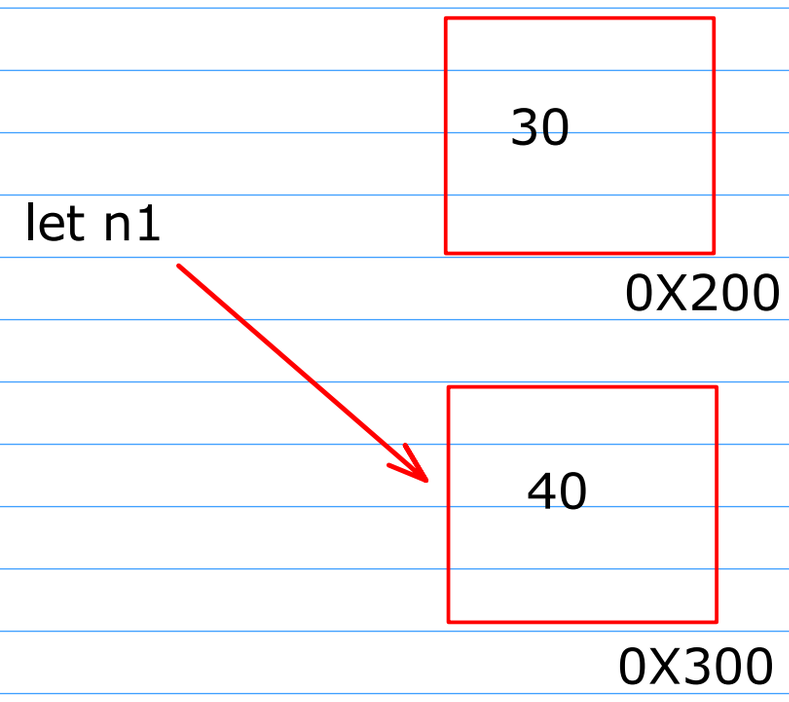
        if(action.type == 'counter/increment')
                newState.count+=action.payload
        elseif(action.type == 'counter/decrement')
                newState.count-=action.payload

        return newState
}
```

```
const incrementAction={
        type:'counter/increment'
        payload:2
}
const decrementAction={
        type:'counter/decrement'
        payload: 1
}
```

```
initialState = CounterReducer(initialState)
```

```
redux toolkit
CounterSlice = createSlice({
        name:'counter',
        initialState:{
                count:0
        },
        reducers:{
                incrementAction:(state,action)=>{
                        state.count+=action.payload
                },
                decrementAction:(state,action)=>{
                        state.count-=action.payload
                }
        }
})
```



- install the readux toolkit
  npm install @reduxjs/toolkit
- install the bindings for the react with redux
  npm install react-redux
