Data Structures and Algorithms - Assignment 3

1. In singly linear linked list implement following operations.

   i. insert a new node after a given data

   ii. insert a new node before a given data

2. Write a function which will insert values in sorted order into linked list.

3. Implement add position and delete position in circular linked list.

Optional

4. Implement singly circular linked list using tail pointer only (no head pointer). Compare time complexities of all operations.

5. Implement menudriven program to maintain linked list of employees and provide below operations (use any type of linked list).

- Add employee (Perfrom any add operation)
- Display all employees
- Search employee by name
- Delete employee by empid
- Update salary of employee
- sort employees by salary
